

Definition of Roles

A Who's Who

SwiftConnect™ has three different user roles. They are as follows:

GLOBAL ADMINISTRATOR

SITE ADMINISTRATOR

USER

Let's define each role so we can understand how everything works:

The **"Global Administrator"** role has access to all sites, and is able to create "Site Administrators". A site is defined exactly the same as in the UniFi® Controller. An "Global Administrator" can create/delete users for any site, manage device from any site, and manually authorize devices from any site.

The **"Site Administrator"** role is exactly like the "Administrator" except this role only has access to one site that is defined when the account is created.

The **"User"** role is meant for the individual that would like to manage the devices they have connected to the network through the SwiftConnect™ Device Manager. The number of devices a user can manage is defined when the account is created and can be modified at any time by a Global Administrator or Site Administrator.
